August 2026

Dear Hiring Manager,

I'm writing about your full-stack engineering role — and because I'd rather be judged on what I've shipped than on what I claim, here is the concrete version.

I'm a full-stack engineer based in Malaysia, five years into building software that companies actually run on. For the last four of them I led frontend architecture at Shinkels Teknik and wrote the services behind it — Node.js and Express REST and GraphQL endpoints, Python Flask APIs where the Python ecosystem was the better fit, authentication and role-based access across both. That role closed in August 2026, which is why I'm writing.

Alongside it I designed, built and shipped three products of my own, each one solo and each one live today. **Sharah CMpro** is an accounting platform with HR built in, where production, payroll and a real double-entry ledger share one database and one permission model — trial balance and balance sheet are derived from the entries staff record daily, not re-keyed. The **Homeopathy Radionic App** takes a practitioner from patient intake to remedy through resumable, autosaving consultations that survive being interrupted by the next patient. The **Quantum Hikmah Certificate Register** began as a spreadsheet I built years earlier and became a Postgres-backed registry with templated, batch certificate issuing. For all three I owned the schema, the API, every screen and the deployment.

That end-to-end habit is the thing I'd bring you. I'm comfortable designing a Postgres schema in the morning, writing the Hono API against it at lunch, and shipping the React screens that consume it before the day is out — then owning the deploy, the bugs and the next iteration. Nothing gets thrown over a wall, and nothing waits on someone else's half of the feature.

I'm equally at home inside a team: I set coding standards, ran code reviews and mentored junior developers at Shinkels. I pair with AI daily and treat it as a tool rather than an author — it makes the first draft fast, and nothing ships unread. I review every line, refactor it to the standard the codebase already holds, and optimise what it got lazily right.

What I'm looking for is a team that ships to real users and cares how the thing is built underneath. If that's the role you're filling, I'd welcome the conversation — and I'm happy to walk you through any of the three systems above, code included.

Sincerely,

Adham Akmal bin Azmi
